ASSESSMENT TOOL 1

COURSE CODE: CSA1001

COURSE NAME: Software Engineering

Name : Dhuneshwaran V

Reg.no : 192324169

Problem 1: Applying Scrum in a Telemedicine App Project

Scenario: A company building a telemedicine mobile app faces challenges with changing requirements. The Product Owner frequently modifies the backlog during sprint planning, lowering team productivity and confusing stakeholders.

Task:

Analyze Scrum roles, identify what caused requirement instability, propose an improved backlog prioritization method, and recommend retrospective action items.

Deliverables:

- Explanation of Scrum roles and responsibilities
- Root cause analysis
- Improved backlog prioritization plan
- Retrospective improvement suggestions

Reasoning:

This mirrors real Agile team challenges such as requirement churn, poor backlog grooming, and team alignment issues skills required for effective Agile project management.

Sprint Planning

Map refined product backlog items into short high-speed clinical delivery iterations.

SELECT TARGET SPRINT

Iteration Commitment Health

Total points allocated vs clinical development capability.

AI Suggester

Analyze Overload

Allocated points: 0 SP

Maximum safe capacity: 26 SP

Committed points are within safe bounds of team velocity. HIPAA and quality assurance testing buffers remain secure.

Select Sprint Backlog

Check/uncheck stories to move them between product backlog and active sprint.

Story changes automatically recalculate iteration compliance indices.
